Petford–Welsh algorithm

The Petford–Welsh algorithm ...

- ... mimics the behaviour of a physical process based on a multi-particle system in statistical mechanics (*the antivoter model* by Donnelly and Welsh),
- ... acts locally; thus, it is highly parallelisable,
- ... has the *weak convergence property*:
If $k > \chi(G)$, there is a positive probability that the algorithm finds a proper k -colouring in a finite number of steps (regardless of the initial colouring).

Petford–Welsh Algorithm

Proposition

A suitably defined parallel variant of the algorithm with a positive probability finds a proper colouring in one (parallel) step starting from any initial colouring, provided that a proper colouring exists.

Consequence

If we increase the number of steps of the algorithm, the probability of reaching a proper colouring becomes as close to 1 as desired.

Žerovnik, J. & Kaufman, M. A parallel variant of a heuristical algorithm for graph coloring – Corrigendum, *Parallel Comput.* **18** (1993), 897–900.
